

THE APIARY · THE WHOLE SUITE

The Apiary

Legion Code × Activerloop

Shared memory, and the hive around it, for your AI coding agents.

THE PROBLEM

AI coding assistants are brilliant in the moment and forgetful the next. They forget what you told them yesterday, they open the wrong files, the local daemons that hold their memory die unnoticed, the dashboard is a port hunt, and once the stack spreads across machines nobody can see the fleet. The memory your agents need is fragile, scattered, and invisible.

THE SOLUTION: ONE HIVE, FIVE PRODUCTS

The Apiary is five small, sharp programs that fix it together, on hardware you control. One captures and serves memory, one makes your code searchable by meaning, and three keep the whole thing alive, visible, and yours.

PRODUCT	THE PROBLEM IT KILLS	WHAT IT DOES
 honeycomb the memory	Your agents forget everything the moment the window closes.	One shared memory that survives sessions and travels across every tool.
 nectar the understanding layer	Your agent opens the wrong files because it searches by name.	Describes every file by what it does, so it finds code by meaning, not names.
 doctor the watchdog	A memory daemon dies at 2am and nobody notices.	Watches the stack, heals what breaks on a repair ladder, never touches your credentials.
 hive the portal	Several services, several ports, and no single place to look.	One always-on portal at 127.0.0.1:3853 for the whole stack.
 queen the fleet orchestrator · coming soon	Once the stack spreads across machines, nobody can see the fleet.	The control plane for liveness, identity, and fleet reporting. Coming soon.

Install the whole apiary: `curl -fsSL https://get.theapiary.sh | sh`
