

The Apiary

FIVE PRODUCTS, ONE MEMORY

LEGION CODE × ACTIVELOOP

What if all your AI coding tools finally shared one memory?

Your assistants are brilliant and forgetful, and each one hoards what little it learns. The Apiary is a stack of small, sharp programs that give all of them one shared memory on Deeplake, on hardware you control, each fixing one stubborn problem. Learn something once, and every agent recalls it everywhere.

What actually remembers my work?

Honeycomb, the shared memory. It captures the useful moments and hands the right notes back to any assistant on any machine, so a decision you reached in one tool is there in the next, even on another laptop.

How does it find the right thing when I forget the words?

Nectar describes your files by what they do and Deeplake searches by meaning, so your agent lands on the right code and the right note even when you would never have guessed the name. It gets sharper the more you use it.

What keeps it alive and easy to see?

Doctor heals the stack before your next prompt when something crashes, and Hive gives you the whole thing at one address you bookmark once. Nothing to babysit, nothing to port-hunt.

Is my code mine?

Yes. Everything lives on Deeplake, reached only by the local helpers on your machine and never by the assistant directly, with secrets never shown. It is one memory, one hive, and it is yours.
