

Find code by meaning, not by file name.

WHY IT MATTERS

Ask your agent where you handle logins and it hunts for login.ts. But the login logic lives in session-refresh.ts, three folders deep, and no name search will ever guess it. Dead end, every time.

Nectar gives every file a short plain-language description of what it actually does, so your agent matches on meaning instead of names. You ask the same questions and get the right files back.

WHAT YOU GET

Meaning, not matching

Nectar reads each file and writes down what it does, like refreshes login tokens on each authenticated request.

Quietly current

Descriptions are written once and kept up to date as files change, moved, or renamed. You do nothing differently.

Fewer dead ends

Your agent points at the file that does the work, not the file that happens to share a name with your question.

THE SPECS

DAEMON 127.0.0.1:3854	SURFACES Auto via Honeycomb recall, plus nectar search
DATA Hive graph + portable registry	PORTABILITY Understanding ships with the project
EMBEDDINGS Provider switching supported	IDENTITY Minted descriptions, trustworthy across a team
