

THE APIARY · THE PORTAL

Hive

One address for your whole Apiary.

THE PROBLEM

The Apiary runs several services on your machine, each on its own port. None of that should be your problem, and port-hunting across loopback tabs is nobody's idea of a dashboard.

WHAT YOU GET

The whole picture, one URL

Memories, projects, the graphs, sync activity, logs, ROI, and settings, in one place with a live health rail on every page.

Honest on a cold boot

Open it mid-startup and you get the buzzing readiness screen, one bee per service, that dismisses itself the moment the fleet is ready.

Last thing standing

Its own service, booted at startup, restarted by Doctor. If one service drops, its panel says so while the rest keeps working.

Yours only

WHY IT HOLDS UP Binds to 127.0.0.1. Passes your session straight through to the services that own your data and stores nothing

✓ Loopback only

✓ One URL to remember

✓ Boot-time service

✓ Stores nothing

SEE IT HOLD UP

A panel says unreachable. Your data is not gone. It means the service that owns that panel is not answering right now. Doctor restarts it, the panel recovers on its own, and the Health page shows exactly which service and since when.

Get started

One command. The whole stack, Doctor included.

```
curl -fsSL https://get.theapiary.sh | sh
```
