

THE APIARY · THE PORTAL

Hive

One address for your whole Apiary.

WHY IT MATTERS

The Apiary runs several services on your machine, each on its own port. None of that should be your problem, and port-hunting across loopback tabs is nobody's idea of a dashboard.

Hive is the front door. One always-on portal at 127.0.0.1:3853 that serves the entire dashboard for everything behind it. Bookmark one address and you are done.

WHAT YOU GET

The whole picture, one URL

Memories, projects, the graphs, sync activity, logs, ROI, and settings, in one place with a live health rail on every page.

Honest on a cold boot

Open it mid-startup and you get the buzzing readiness screen, one bee per service, that dismisses itself the moment the fleet is ready.

Last thing standing

Its own service, booted at startup, restarted by Doctor. If one service drops, its panel says so while the rest keeps working.

THE SPECS

PORTAL ADDRESS 127.0.0.1:3853	BINDING Loopback only. Nothing off-device.
FEDERATION Server-side BFF proxy over local loopback	BOOT OS service at startup, watched by Doctor
LOGIN Guided Deeplake device flow at /login	STORES Nothing. Session pass-through.

Get started

One command. The whole stack, Doctor included.

```
curl -fsSL https://get.theapiary.sh | sh
```
