

THE APIARY · THE MEMORY

Honeycomb

One shared, lasting memory for all your AI coding agents.

THE PROBLEM

AI coding assistants are brilliant in the moment and forgetful the next. Close the window and the context is gone. Open a different tool tomorrow and it has never heard of your project.

THE PROMISE

Honeycomb gives every one of your agents a single shared memory that survives sessions, travels across tools, and gets sharper over time. Learn something once, and it is there everywhere.

WHAT YOU GET

Memory that survives

What you figured out yesterday is waiting today, already summarized. No re-explaining every morning.

Memory that travels

A note written in one assistant is recalled by another. Plugs underneath Claude Code, Cursor, and Codex today.

Skills that spread

Solve something reusable and Honeycomb turns it into a shareable skill that shows up for the whole team, no copy-paste.

Sharper, not noisier

It tidies its own notes, merging duplicates and dropping junk, keeping the current version of a fact.

WHY IT HOLDS UP

✓ Claude Code · Cursor · Codex

✓ Deeplake-backed

✓ Self-host option

✓ MCP + CLI + API

SEE IT HOLD UP

Capture a decision once in one assistant. Recall it anywhere: same daemon, same Deeplake, any harness. A discovery by one engineer reaches the whole team on their next session.

Get started

One command. The whole stack, Doctor included.

```
curl -fsSL https://get.theapiary.sh | sh
```
