

THE APIARY · THE FLEET ORCHESTRATOR

Queen

See and steer the whole fleet. Never touch the memory.

THE PROBLEM

Clean on one machine, the Apiary gets hard to see once it spreads across machines, teammates, and throwaway workers. Who is alive, who may mint identity, what to cut when a laptop walks out.

THE PROMISE

Queen is the control plane beside the Deeplake data plane. It carries liveness, identity, enrollment, signed commands, usage observation, and fleet reporting. Nothing else.

WHAT YOU GET

Fleet at a glance

Every agent in your org with derived health, healthy versus offline by heartbeat age.

Custody stays with you

Your orchestrator holds the Deeplake credential, not the cloud. Queen coordinates blobs it cannot decrypt.

Enroll without ceremony

Approve a machine in the cloud and a custodian device finishes the rewrap. A headless VPS joins with a join-only token.

Revocation as policy

Cut a stolen device and rotate the credential as two honest steps, not improv.

WHY IT HOLDS UP

✓ Control plane only

✓ Never reads memory

✓ BYOC enforcement

✓ Org-scoped

SEE IT HOLD UP

Memory and skills stay on Deeplake, where they already work. Queen owns seeing and steering the fleet that writes to it, and never touches memory content.

Get started

One command. The whole stack, Doctor included.

`curl -fsSL https://get.theapiary.sh | sh`
