

THE APIARY · THE FLEET ORCHESTRATOR

Queen

See and steer the whole fleet. Never touch the memory.

WHY IT MATTERS

Clean on one machine, the Apiary gets hard to see once it spreads across machines, teammates, and throwaway workers. Who is alive, who may mint identity, what to cut when a laptop walks out.

Queen is the control plane beside the Deeplake data plane. It carries liveness, identity, enrollment, signed commands, usage observation, and fleet reporting. Nothing else.

WHAT YOU GET

Fleet at a glance

Every agent in your org with derived health, healthy versus offline by heartbeat age.

Custody stays with you

Your orchestrator holds the Deeplake credential, not the cloud. Queen coordinates blobs it cannot decrypt.

Enroll without ceremony

Approve a machine in the cloud and a custodian device finishes the rewrap. A headless VPS joins with a join-only token.

THE SPECS

MODEL Two-application: local agent + cloud control plane	BOUNDARY Postgres behind an edge API. No memory content.
STACK Cloudflare Workers + Hyperdrive + managed Postgres	PRESENCE Heartbeat + status-on-change, TTL reaping
DASHBOARD Read-only fleet view, org-scoped	LICENSING Cloud binding and BYOC enforcement

Get started

One command. The whole stack, Doctor included.

```
curl -fsSL https://get.theapiary.sh | sh
```
